

Minimum space for maximum control

Luceo has launched a new packaging inspection unit, extending the ThermoSecure range once again to meet manufacturers' requirements

Food packaging must attract consumers and show the detailed information that is required by law. Luceo has introduced a compact inspection unit that is easy to install.

Full control over packaging – marking and labelling

ThermoSecure B200 checks the position of the labels, the quality of silk screening and alignment and reads variable information (best before date, barcodes, etc) regardless of the character set and the orientation, size and colour of the packaging. It also checks the coherence of the weight/price information of the packaged products (meat, cheese, prepared foods, etc) automatically and at high throughput.

Easy to install and easy to use – plug and play

The ThermoSecure B200 can be installed easily on the production line, along with a metal detector, between wrapping and packing – it is only 30 centimetres long. This new detector incorporates the most recent developments from Luceo to ensure that it is easy to use, in particular when setting up.

100% inspection of the quality of individual packaging is LUCEO's core business. The ThermoSecure range has units for a wide variety of manufacturing requirements. This simple inspection unit joins a model for building in to a FFS machine and an independent inspection machine with automatic rejection.

About Luceo

LUCEO is a brand of the TIAMA group, the world leader in innovative vision inspection systems. LUCEO is backed up by the TIAMA group's international experience and the reputation of its top-class customer service and produces a range of equipment designed to meet quality, traceability and food safety requirements.
